PrizeRail

Verifiable cross-chain prize settlement

The game records the winner.
PrizeRail proves the result and enforces the payout.

Project Deck | September 2026

The settlement trust gap

An on-chain result can still end in an off-chain promise.

A tournament contract may record a winner correctly, while the prize still depends on an organizer to verify the result, select the recipient, and release the funds.

RESULT

Winner recorded on Sepolia

PAYOUT

Still depends on trust

PrizeRail closes this gap with a funded policy and verifiable receipts.

What PrizeRail does

PrizeRail settles the result that a registered game contract recorded.

1. Prove the source result

Attestcoin establishes transaction inclusion and canonical history for the Sepolia result.

2. Check the payout policy

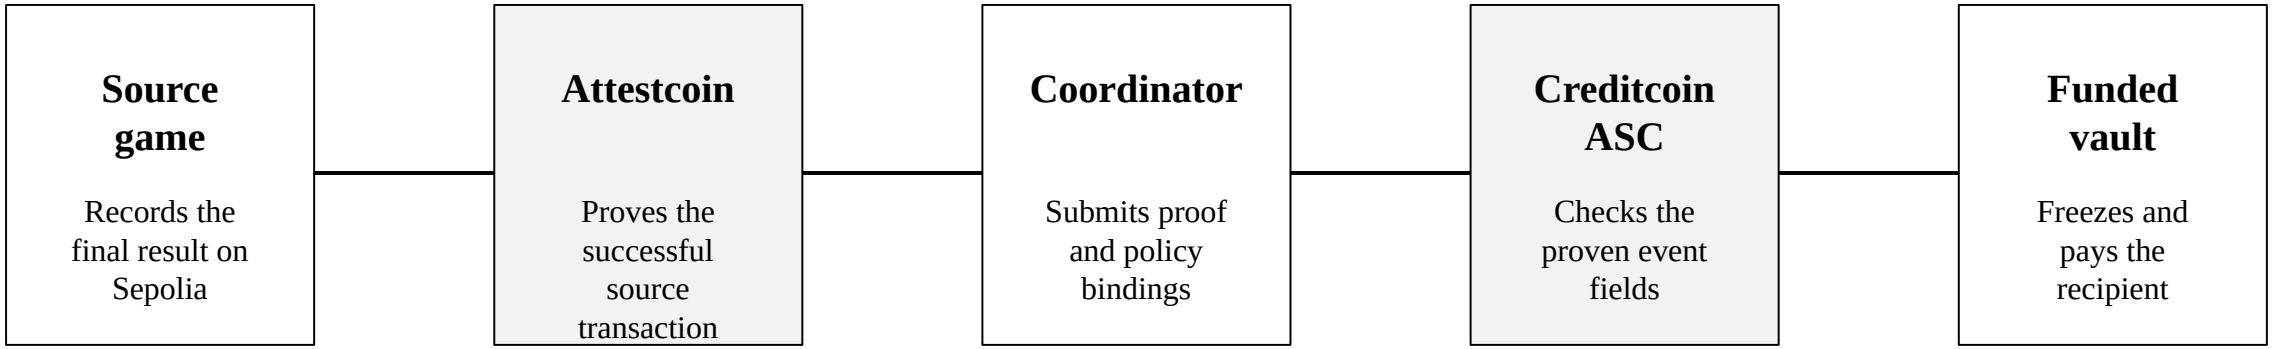

Creditcoin validates the source, event, tournament, rules, winner, nonce, and deadline.

3. Pay the frozen winner

A funded vault becomes claimable only after every required predicate matches.

The worker coordinates submission. The contracts decide whether settlement is valid.

Cross-chain settlement architecture

Authority stays separated

The game determines who won. Attestcoin proves the source transaction. Creditcoin controls settlement and accounting.

End-to-end settlement flow

1

Fund

A policy reserves the PRIZE test token on Creditcoin.

2

Record

The source game finalizes a winner on Sepolia.

3

Prove

Attestcoin accepts the source block preflight.

4

Settle

Creditcoin validates every bound field.

5

Claim

Any caller can trigger payment to the frozen winner.

6

Reject replay

A second submission mines with status zero.

Verified testnet evidence

The explicit v2 evidence bundle returned OVERALL: PASS through the public read-only verifier.

Evidence	Network	Outcome	Recorded detail
Source receipt	Sepolia	**Status 1**	Block 11691988
Attestcoin preflight	Chain key 1	**PASS**	Proof metadata recorded
Settlement receipt	Creditcoin CC3	**Status 1**	Block 5477570
Payout receipt	Creditcoin CC3	**Status 1**	Block 5477573
Replay attempt	Creditcoin CC3	**Status 0**	Block 5477585

Evidence file: worker-live-v2-2026-09-12T22-53-43-237Z-2056792-055a2cae90a0.json

Payout integrity

Frozen beneficiary

A permissionless caller can trigger the claim, but cannot choose a different recipient.

CLAIMABLE ——— **CLAIMED**

Replay protection

The same result was submitted again. The transaction was mined, returned status zero, and produced no second payout.

FIRST PAYOUT **PASS**

Reusable settlement infrastructure

PrizeRail sits after the source application has already produced a result.

01	**Tournament prizes**	Settle a recorded tournament winner against a prefunded policy.
02	**Competitive game rewards**	Keep gameplay logic separate from cross-chain prize custody.
03	**On-chain contest payouts**	Bind payment to a specific source event and frozen beneficiary.
04	**Protocol incentive programs**	Make claims inspectable through receipts and public verification.

Current status and proof boundary

Working on testnet

- ✓ Sepolia source result
- ✓ Recorded Attestcoin preflight evidence
- ✓ CC3 semantic settlement
- ✓ Winner claim and replay rejection
- ✓ Public no-key verifier

Deliberate limitations

1. PRIZE is a project-owned test token with no monetary value.
2. PrizeRail does not detect off-chain cheating.
3. The public bundle records proof metadata, not raw proof bytes.
4. The project does not claim mainnet readiness, custody, or an audit.

PrizeRail

The game decides who won.
Attestcoin proves it.
Creditcoin pays them.
